Application: Head of Operations & Member Experience, Health Roundtable

Dear Hiring Team,

Let me start with what I do not bring. I have not worked inside the ANZ health system, I have not run a membership organisation, and I have not sat alongside clinical informatics teams. If any of those are non-negotiable, I would rather you know it in the first paragraph than the last.

What I do bring is the problem in your opening. AVJennings was built on trusted, relationship-led selling that could not scale on relationships alone. Over seven years I owned the digital experience platform end to end and took it from fragmented touchpoints to a coherent system: legacy Sitecore to a headless Storyblok architecture, governance covering user access, content workflows and quality assurance, ownership of test plans and user acceptance testing through to go-live sign-off, and accountability for stability and optimisation afterwards rather than treating launch as the end.

The line I keep returning to is the one about keeping the human connection your members trust you for. That is the real difficulty. Digital enablement of a relationship business fails on the moment members feel they have been converted from participants into users, not on the technology. What made it work for me was bringing the people who held the relationships into prioritisation early, rather than presenting them a finished roadmap and asking for adoption.

On operating cadence, I have run the prioritisation cycle with business stakeholders, maintained the backlog, sequenced against capacity, converted research into requirements and user stories with UX and technology, and owned release and incident communications. At PageGroup I delivered the Salary & Employment Outlook and Future of Work platforms across Asia Pacific: benchmark reporting products that turned proprietary data into insight clients acted on. That is the closest analogue I have to what Health Roundtable does, and it taught me how much of the value sits in making data legible rather than in collecting it.

On AI I will be precise about scale, because the word is doing a lot of work in the market at the moment. I have designed and shipped AI-assisted features to live production sites, including client work, so this is not a theoretical interest. What I have not done is put natural language querying over an enterprise benchmarking dataset into production, and the distance between those two things is real. What I bring is judgement about where AI genuinely improves a decision and where it is decoration, which is close to the standard your own ad sets, plus the habit of shipping rather than debating. I would lean on Advanced Analytics and the Technical Lead for the how, and hold the line on the why.

Through Tydal I currently work with clients including Ryan Maxwell Event, a producer bringing Chinese and Australian orchestral programmes to stages in both countries, which is a standing reminder that a platform lives or dies on whether the audience feels invited. I am Sydney-based and available now, hold a Certified Marketing Professional designation from the Australian Marketing Institute and a postgraduate diploma in innovation and design thinking from MIT. A short overview of how I map to this role sits at vinayraja.com/jobs/healthroundtable.

Better has no limit is a good line to hire against. I would like the chance to be measured on it.

Kind regards,

Vinay Raja
